

Octavo booklet, manuscript dedication inscription partly covered by pasted lined slip, ownership inscription, folding lithographed map (726 by 604mm) with two closed tears, title, 58pp, folding colour lithographed plate, folding colour lithographed map (215 by 220mm), spotted, original black morocco covers, title and date lettered in gold to upper board.

LONDON WATER COMPANY

London (Watford) Spring-Water Company Report to the Directors.

Author

HOMERSHAM, S[amuel] C[ollett]

Publication date

1850

Publisher

John Weale,

Publication place

London,

Physical description

Octavo booklet, manuscript dedication inscription partly covered by pasted lined slip, ownership inscription, folding lithographed map (726 by 604mm) with two closed tears, title, 58pp, folding colour lithographed plate, folding colour lithographed map (215 by 220mm), spotted, original black morocco covers, title and date lettered in gold to upper board.

Dimensions

Notes

This report marks a particularly interesting point in the history of London's water supply. During the 1840s, interest began to develop in extracting water from springs in the extensive chalk formations around London. There was a growing public concern with the water supply. Arthur Hill-Hassall analysed samples of water from the Thames under a microscope, finding large amounts of 'animalcules' – organic matter that contemporary scientists could not explain, driving further worries about water cleanliness. John Snow published his work 'On the Mode of Communication of Cholera' in 1849, based on his observations of the epidemic in that year and in 1832, presenting the theory that the disease was water- rather than airborne.

The London (Watford) Spring-Water Company was set up in 1850. They took advantage of the public concern with water and in particular with 'animalcules' by commissioning a report from two scientists on the water above Teddington Lock from the Thames (where the capital's other companies took their water from) and water from Watford Springs, showing that the latter was as "free from organic matter as any water can be in its natural state" (Jones). They aimed not only to improve the quality of water in the capital but also to break the monopolies held by water companies who were providing water from the Thames at high prices.

This copy of the report was presented by Robert Paten (1788-1861), a civil engineer. He sunk an experimental well in Watford in 1840 (illustrated in the folding plate) and gave evidence to the House of Lords about the suitability of the springs. His account of the experiment is included in the booklet.

The booklet itself is written by Samuel Collett Homersham (c1816-1886), an hydrologist who worked on problems of water supply throughout England. He provides evidence for the purity of the water from chalk beds (hence the inclusion of the geological map of the United Kingdom at the back of the booklet, showing Watford's position within a chalk belt). He also describes how the water would be transported to London. The map at the front of the booklet shows the proposed route in red.

Unfortunately, the scheme was never approved.

Bibliography

Emma M. Jones, *Parched City* (John Hunt, 2013).

Provenance

Provenance

1. Presentation inscription to J.G. Read [?] of Addiscombe Road, Watford, from Robert Paten.
2. Ownership inscription of Charles Waterman, possibly a member of the Waterman family living in Watford.
